DETAILED ACTION

Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claim 12 recites the limitation "the bladder fluid is a reagent" in the 2nd to 3rd line of the claim. There is insufficient antecedent basis for this limitation in the claim. Claim 12 is dependent on claim 1 which does not recite a bladder or even a bladder fluid. The only mention of a structure that is similar to a bladder is the bulb pump. It appears that claim 12 is to be dependent on claim 11. If claim 12 was rewritten to depend from claim 11, it would then have proper antecedent basis for the limitation "the bladder fluid is a reagent."

Double Patenting

Claims 1 and 8-12 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-4 of U.S. Patent No. 6,660,527. Although the conflicting claims are not identical, they are not patentably distinct from each other because the instant claims 1 and 8-12 are a broader version of the 6,660,527 patent. 6,660,527 claims include all the limitations found in the presently pending claims 1 and 8-12. Thus the presently pending claims are encompassed by or anticipated by the 6,660,527 claims.

Allowable Subject Matter

Claims 2-7 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Conclusion

The prior art made of record are related to general bulb pumps which withdraw a sample into a channel and pass the sample to a test media where the sample is analyzed (Shartle et al. Eisenson, Harding et al., Boyd et al. Naka et al.). The prior art does not teach or fairly suggest a fluid transfer inlet and outlet each with check valves, a bladder located between the inlet and outlet, a depressable bulb pump, depressing and releasing the bulb pump to draw a fluid into the interior of the bulb through an inlet check valve, then depressing the flexible member to impart a positive pressure in the interior of the flexible member to pump the fluid to a test media.
